DOCUMENT TYPE: Dissertation

FILE SEGMENT: DAI

LANGUAGE: English

AB Human Cytomegalovirus (HCMV) and Herpes Simplex Type I Virus (HSV-1) are two herpes viruses that frequently arise as opportunistic infections in immuno-compromised individuals (Cavert, 1997). Many drug resistant strains of herpes viruses have been identified (Erice, A., 1999). Thus, it is important to identify and develop new lead molecules with antiherpes activity. 3,7-Dimethoxy-1-hydroxyacridone and 5-chloro-1,3-dihydroxyacridone have been found to be selective inhibitors of HCMV and HSV-1 replication, respectively, in in vitro tissue culture assays. The HSV-1 lead was discovered during a screen of 1,3-dihydroxyacridones that were previously synthesized for the purpose of investigating the structure activity relationships around mammalian topoisomerase II inhibition. The rationale behind the antiviral screening of these molecules was based on the fact that toposiomerase II is a cellular target that is required by viruses to carry out viral replication. Interestingly, 5-chloro-1,3-dihydroxyacridone was not an inhibitor of topoisomerase II. The results of the HSV-1 studies prompted a second screen for HCMV inhibition. The second screen identified 3,7-dimethoxy-1-hydroxyacridone as a highly selective and potent HCMV lead. Both lead molecules appear to represent novel structural and or mechanistic classes of antiviral agents. Studies have shown that the HSV-1 lead does not interfere with viral DNA replication, or viral late protein production/accumulation. It has been shown to interfere with the cleavage and packaging part of the viral life cycle in a dose dependent fashion (Akanitapichat, P., 1999). Preliminary experiments using the HCMV lead are indicative of a cellular target rather than a viral target. Series of analogs have been prepared for both lead molecules. The synthetic goal of the study was to investigate the SAR of both leads through an iterative process of analog synthesis and biological evaluation. A strategy of bioisosteric replacement, deletion, and modifications of key functional groups was utilized. In addition, some regioisomeric analogs were targeted. Solution phase parallel synthesis was also pursued as a means of analog preparation. Through this combination of traditional and modern medicinal chemistry techniques, several new active analogs of both the lead molecules were identified.
